

## **Buddy CI:**

Buddy is one of the newest CI's so it has the advantage of knowing the issues and frustrations of earlier CI's so Buddy tries to correct these and make things easier to use. You won't find a DevOps cloud service that offers as many supported operations, actions and events as Buddy.

Overall it is very easy to get started and navigate your way to being able to use the site. It populates your git hub repos immediately and you can search. Once you click you on the one you want it will go to the next screen and add a pipeline. From there it is very simple to use. There are some tutorials that can be found but not as regularly as others that have been around longer.

<https://medium.com/the-devops-corner/jenkins-and-buddy-c629d5d5e564>

Above is a good site to use if you need help getting started.

Buddy has been around since 2015 not sure how popular it is but it definitely is liked by most that use it. Earliest public commit that i see is from 2016

## **Raygun real time error monitoring:**

Raygun has an easy setup and integrates to applications very simple. There are step by step instructions which will help you get started quickly. It is highly customizable and once it's set up it's easy to start using the advanced features.

<https://raygun.com/blog/welcome-to-raygun/>

Above is a link for the essential setup and below that is the advanced setup.

<https://raygun.com/documentation/search/>

Above is a link that has so much documentation for whatever you're looking for.

I did not sign up but from the essential setup it seems as though it would be very easy to get started. The earliest github repo was in 2014 and most recent was yesterday. It seems as though there have been quite a few people and small businesses that have switched over to raygun. It also seems like it is better for small and medium sized businesses.
